

EXECUTIVE THESIS BRIEF

Mandate, company moment and operating contradictions

Mandate hypothesis

Create one measurable operating system that turns XTIUM's combined platforms, teams and AI capabilities into repeatable managed-service outcomes - first internally, then in customer environments.

COMPANY MOMENT

- ATSG and Evolve IP have been unified under XTIUM, creating a global full-stack MSP across cloud, workplace, network, communications, security, service desk and AI.
- Leadership has described 2026 as a growth year and said internal AI capabilities will be packaged for customers.
- XTAI, MPaaS, OPTX, Enterprise Service Desk and the Talkdesk partnership create a broad operating surface where platform, workflow and customer-experience integration matter.
- Public positioning emphasizes security-first service, one accountable partner, automation, measurable outcomes and high-touch access.

FOUR OPERATING CONTRADICTIONS

- Integration vs continuity - create common mechanisms without disrupting customer relationships or useful local practices.
- Automation vs trust - increase speed and consistency while preserving security, evidence, escalation and human accountability.
- Standardization vs variation - reduce duplication without flattening legitimate service, industry, regional and customer differences.
- Internal leverage vs customer offering - convert internal AI wins into governed deployment patterns that do not depend on insider context.

CANDIDATE THESIS

Run it inside. Make it repeatable outside. Every AI-enabled service improvement should leave behind a customer promise, trigger/context definition, AI role, human authority, evidence standard, ownership model and adaptation guide.

EXECUTIVE THESIS BRIEF

Operating model, scorecard and competitive landscape

Pittsburgh, PA - actively relocating to Tampa Bay | 412.287.8640 | russelldudek@gmail.com

ONE SERVICE DEFINITION

- Customer promise - the outcome, scope and exclusions.
- Trigger and context - the request, telemetry, identity, policy, inventory and history required.
- AI role - what may be retrieved, recommended, generated, predicted or acted on.
- Human authority - what a person must approve, interpret, communicate, stop or roll back.
- Evidence standard - customer value, operating quality, economics, trust and adoption.
- Ownership and escalation - who owns the service, exceptions, improvement and customer review.

TWO-RUN TRANSFER TEST

Run 01 - Inside XTIUM

Does the workflow perform in real operations? Are failures, overrides, controls and evidence visible?

Run 02 - For the customer

Can the pattern be explained, adapted, governed, measured and owned without insider knowledge?

PROPOSED SCORECARD

- Customer: effort, satisfaction, first-contact resolution, reopen/escalation and self-service adoption.
- Operations: time to acknowledge/resolve, handoffs, recurring incidents and automation override.
- Economics: cost to serve, labor hours avoided, rework, tooling duplication and pattern contribution.
- Trust: security/control exceptions, traceability, human-review agreement and rollback quality.
- Integration: common-workflow adoption, variants retired, pattern reuse and proof-to-offer latency.

COMPETITIVE LANDSCAPE

- Global integrators bring scale and end-to-end AI delivery; XTIUM can counter with operating intimacy and faster transfer velocity.
- Vertical specialists make governed AI credible through industry context; XTIUM needs explicit vertical deployment patterns around shared capabilities.
- AI-native aggregators make centralized operating leverage a consolidation thesis.
- Platform vendors increasingly automate core service workflows; XTIUM must own the outcome, exceptions, adoption and trust.

EXECUTIVE THESIS BRIEF

Evidence, objection, entry logic and executive questions

Pittsburgh, PA - actively relocating to Tampa Bay | 412.287.8640 | russelldudek@gmail.com
linkedin.com/in/russelldudek | https://russelldudek.github.io/XTIUM/

EVIDENCE MAP

- Vape-Jet - current AI-first operating transformation across support, customer success, engineering issue flow, ERP, telemetry, standard work and a software-enabled machine fleet.
- Amazon - 24/7 customer-backward operations, labor planning, throughput visibility, escalation and Lean/Gemba mechanisms.
- Compunetics - engineering, manufacturing, quality and customer delivery in high-reliability technical environments.
- DudeWorth - agentic workflow patterns connecting retrieval, AI agents, human judgment, evaluation, governance, adoption and time-to-value.

HARD OBJECTION

No direct global-MSP executive tenure

Do not claim equivalence. Test the transfer case through a bounded workflow diagnostic: map one service flow, expose decision rights and evidence, identify operating variants, and produce a practical internal-to-customer deployment mechanism.

FIRST 120 DAYS

- 0-30: map service reality, integration variants, decision rights and baseline measures.
- 31-60: select two lighthouse workflows and complete One Service Definitions.
- 61-90: prove internally; observe exceptions, overrides, trust and adoption.
- 91-120: package customer deployment playbooks and establish scale/adapt/hold/stop governance.

EXECUTIVE QUESTIONS

- Which internal AI-enabled workflow is closest to becoming a customer offer, and what blocks transfer?
- Where is standardization creating leverage, and where would it damage legitimate variation?
- How do product, operations, security and customer teams decide when AI is ready to operate as a managed service?
- What measures would prove that AI improves customer outcomes and economics?
- Where does one-accountable-partner positioning create the greatest hidden integration burden?
- What is the strongest reason not to create a dedicated operating mandate at this intersection?
