WORKFLOW / SERVICE	CUSTOMER / ENVIRONMENT	OWNER	REVIEW DATE

Use Complete the six fields with frontline, product, security and customer stakeholders. Test the definition twice: first in XTIUM operations, then in the customer's operating context.

1. Customer promise

What outcome should the service reliably create? What is explicitly outside scope?

2. Trigger and context

What request, telemetry, identity, policy, inventory and history are required?

3. AI role

What may AI retrieve, recommend, generate, predict or act on?

4. Human authority

What must a person approve, interpret, communicate, stop or roll back?

5. Evidence standard

What measures prove customer value, operating quality, economics, trust and adoption?

6. Ownership and escalation

Who owns the service, exceptions, improvement, customer review and deployment adaptation?

TWO-RUN TRANSFER TEST

Run 01 - Inside XTIUM

Actual performance, failures, overrides, controls and evidence are visible.

Run 02 - For the customer

The pattern can be explained, adapted, governed, measured and owned without insider knowledge.

DISPOSITION

☐ Scale common pattern

☐ Adapt for context

☐ Hold pending evidence

☐ Stop
